<b>You must have:</b> Ruler, calculator	Total Marks
--	-------------

### Instructions

- Use **black** ink or ball-point pen.
- **Fill in the boxes** at the top of this page with your name, centre number and candidate number.
- Answer **all** questions.
- Answer the questions in the spaces provided  
– *there may be more space than you need.*
- Show all the steps in any calculations and state the units.
- Some questions must be answered with a cross in a box ☒. If you change your mind about an answer, put a line through the box ☒ and then mark your new answer with a cross ☒.

### Information

- The total mark for this paper is 120.
- The marks for **each** question are shown in brackets  
– *use this as a guide as to how much time to spend on each question.*

### Advice

- Read each question carefully before you start to answer it.
- Write your answers neatly and in good English.
- Try to answer every question.
- Check your answers if you have time at the end.

**Answer ALL questions.**

**1** Use the the Periodic Table on page 2 to answer this question.

(a) (i) The symbol for silver is

(1)

- A** Ag     **B** As     **C** S     **D** Si

(ii) The element with an atomic number of 40 is

(1)

- A** Al     **B** Ar     **C** Ca     **D** Zr

(b) An atom of an element has the electronic configuration 2.8.3

(i) State the number of the group in the Periodic Table in which this element is found.

(1)

(ii) Explain your answer in terms of the atom's electronic configuration.

(1)

(iii) State the number of the period in the Periodic Table in which this element is found.

(1)

(iv) Explain your answer in terms of the atom's electronic configuration.

(1)

(v) Identify the element.

(c) Bromine water can be used to distinguish between ethane and ethene.

ethane

ethene

Describe what you would observe when orange bromine water is added separately to ethane and ethene, in the absence of UV light.

(2)

observation with ethane.....

observation with ethene.....

**(Total for Question 2 = 8 marks)**

- 3 The table shows the percentage composition of the mixture of gases in the exhaust fumes of a car.

Name of gas	Percentage of the gas in the exhaust fumes
carbon dioxide	14.0
carbon monoxide	2.0
hydrocarbons	0.3
nitrogen oxides	0.2
sulfur dioxide	trace amounts
water vapour	12.0
gas Z	71.5

- (a) Identify gas Z.

(1)

- (b) The carbon dioxide is produced from the combustion of hydrocarbons such as octane. Complete the word equation for the complete combustion of octane.

(1)

octane + ..... → carbon dioxide + .....

- (c) How is the carbon monoxide in the exhaust fumes produced?

(1)

- (d) (i) Write a chemical equation to show how nitrogen dioxide ( $\text{NO}_2$ ) is produced in a car engine.

(1)

- (ii) State one problem caused by nitrogen dioxide in the atmosphere.

(1)

(Total for Question 3 = 5 marks)

4 A sample of air is passed through the apparatus shown in the diagram.

The anhydrous copper(II) sulfate turns from white to blue.

The limewater turns milky.

The copper turns black.

(a) Name the substance that turns anhydrous copper(II) sulfate blue.

(1)

(b) Name the substance that reacts with limewater to make it turn milky.

(1)

(c) Explain why the copper turns black.

(2)

(Total for Question 4 = 4 marks)

- 5 A student carries out an investigation into the reaction between magnesium carbonate and dilute sulfuric acid. He uses this apparatus.

The student carries out seven experiments. In each experiment he uses the same mass of magnesium carbonate but a different volume of acid. He measures the total volume of carbon dioxide collected in each experiment. The table shows his results.

Volume of sulfuric acid used in $\text{cm}^3$	0	5	15	20	25	30	35	40
Volume of carbon dioxide collected in $\text{cm}^3$	0	16	47	61	64	78	80	80

- (a) Plot the results on the grid and draw a curve of best fit.

(3)

(b) (i) Which volume of sulfuric acid produces an anomalous result? (1)

.....

(ii) Explain what the results with 35 cm<sup>3</sup> and 40 cm<sup>3</sup> of sulfuric acid indicate about the reaction. (2)

.....

.....

.....

(iii) Use the graph to find the volume of carbon dioxide that would be collected if 10 cm<sup>3</sup> of acid were used. (1)

volume of carbon dioxide = ..... cm<sup>3</sup>

(iv) Use the graph to find the volume of sulfuric acid that would result in 55 cm<sup>3</sup> of carbon dioxide being collected. (1)

volume of sulfuric acid = ..... cm<sup>3</sup>

**(Total for Question 5 = 8 marks)**

.....

6 In 1774, the scientist Joseph Priestley produced oxygen by heating mercury(II) oxide, (HgO). When heated, mercury(II) oxide breaks down into its elements.

(a) (i) Write a chemical equation for the breakdown of mercury(II) oxide into its elements. (1)

(ii) What name is given to this type of reaction? (1)

(b) Priestley's method of producing oxygen is no longer used because of the high toxicity of mercury and mercury compounds.

A student prepares oxygen by adding hydrogen peroxide solution to solid manganese(IV) oxide.

The diagram shows the apparatus used.

The equation for the reaction is

(i) Give the name of the apparatus that contains the hydrogen peroxide solution. (1)

(ii) Suggest how the first sample of gas collected may be different from the samples collected later. (1)

(c) A catalyst increases the rate of decomposition of the hydrogen peroxide.

Describe a method you could use to show that the manganese(IV) oxide is acting as a catalyst in this reaction.

(4)

(Total for Question 6 = 11 marks)

7 Zinc is added to dilute hydrochloric acid. The equation for the reaction is

An experiment is carried out using

- 0.12 g of powdered zinc
- an excess of 0.2 mol/dm<sup>3</sup> hydrochloric acid
- a temperature of 20 °C

The volume of hydrogen collected in the experiment is measured at regular time intervals.

Curve B shows the results obtained.

(a) The experiment is repeated using

- 0.12 g of powdered zinc
- an excess of 0.2 mol/dm<sup>3</sup> hydrochloric acid
- a temperature of 40 °C

Explain which curve, A, B or C, shows the results obtained.

(3)

.....

.....

.....

.....

.....

.....

(b) The experiment is repeated again, using

- 0.06 g of powdered zinc
- an excess of 0.2 mol/dm<sup>3</sup> hydrochloric acid
- a temperature of 20 °C

Explain which curve, A, B or C, shows the results obtained.

8 Three aqueous solutions are sodium chloride, sodium iodide and silver nitrate. They are in containers labelled X, Y and Z. It is not known which solution is in each container.

The solutions are mixed together as shown in the table, and the observations recorded.

Experiment	Observation
solution X added to solution Y	yellow precipitate formed
solution X added to solution Z	no change
solution Y added to solution Z	white precipitate formed

(a) Explain how the results show that Y is aqueous silver nitrate.

(1)

.....

.....

(b) Explain how the results can be used to identify both X and Z.

(2)

.....

.....

.....

(c) Aqueous chlorine is added to separate aqueous solutions of sodium chloride and sodium iodide.

Explain how the observations made can be used to distinguish between sodium chloride and sodium iodide.

9 Iron is extracted from its ore using a blast furnace.

(a) The iron ore is mixed with two other raw materials and put into the top of the furnace.  
Give the names of the two other raw materials.

(2)

1

2

(b) The most common ore used is haematite, which contains iron(III) oxide,  $\text{Fe}_2\text{O}_3$ .  
The oxide is converted into iron by reaction with carbon monoxide, CO

(i) Write a chemical equation for the reaction between iron(III) oxide and carbon monoxide.

(2)

(ii) Explain which element is reduced in this reaction.

(2)

(c) The iron from the blast furnace contains about 10% by mass of impurities.

Two of the impurities are carbon and silicon.

The diagram shows a method of decreasing the amounts of carbon and silicon in the iron.

The oxygen converts carbon and silicon into their oxides.

The carbon dioxide escapes as a gas. Silicon dioxide reacts with the calcium oxide to form molten slag.

(i) Write a chemical equation for the reaction between carbon and oxygen to form carbon dioxide.

(1)

(ii) The equation for the reaction between silicon dioxide and calcium oxide to form slag is

What type of reaction is this?

(1)

- A combustion
- B decomposition
- C neutralisation
- D redox

(d) One problem with using iron is rusting.

(i) Name the two substances that must be present for iron to rust.

(2)

1 .....

2 .....

(ii) One method of preventing iron from rusting is to paint it.

State how this method of rust prevention works.

(1)

.....

.....

(e) Iron can also be protected from rusting by coating it with zinc.

(i) Give the name of this type of protection.

(1)

.....

(ii) Explain how this method of protection works, even when the surface of the zinc is scratched to expose the iron underneath.

(2)

.....

.....

.....

(f) Aluminium is extracted from its oxide using electrolysis.

(i) Why is aluminium **not** extracted by heating its oxide with carbon monoxide?

(1)

.....

.....

(ii) Why is iron **not** extracted from its oxide using electrolysis?

(1)

.....

.....

(Total for Question 9 = 16 marks)

10 Alkenes are unsaturated hydrocarbons.

(a) State what is meant by the term **unsaturated**.

(1)

.....

.....

(b) One method of producing alkenes is by cracking alkanes.

(i) Complete the equation for the cracking of decane into octane ( $C_8H_{18}$ ) and ethene.

(1)

(ii) State two conditions used for cracking alkanes in industry.

(2)

.....

.....

.....

(c) The diagram shows two alkenes that are isomers of each other.

(i) Explain why these two compounds are isomers.

(2)

P 4 6 8 1 4 A 0 2 1 3 2

- 11 The apparatus shown in the diagram can be used to investigate the colours of the cobalt(II) ion ( $\text{Co}^{2+}$ ) and the chromate ion ( $\text{CrO}_4^{2-}$ ) in cobalt(II) chromate.

These are the results of the experiment.

- a pink colour moves towards electrode A
- a yellow colour moves towards electrode B

(a) Explain how the results show that the chromate ion is yellow.

(2)

.....

.....

.....

.....

(b) (i) Chromate ions in aqueous solution can be converted into dichromate ions ( $\text{Cr}_2\text{O}_7^{2-}$ ) by the addition of hydrogen ions.

Balance the equation that represents this reaction.

(1)

(ii) Which solution is a source of hydrogen ions for this reaction?

(1)

- A  $\text{H}_2\text{O}_2(\text{aq})$
- B  $\text{HCl}(\text{aq})$
- C  $\text{NaOH}(\text{aq})$
- D  $\text{NH}_3(\text{aq})$

(c) When aqueous potassium chromate is added to aqueous lead(II) nitrate, a bright yellow precipitate is formed.

(i) Complete the equation for the reaction by inserting the missing state symbols.

(ii) Describe how you could obtain a pure, dry sample of the insoluble solid from the final reaction mixture.

12 A student uses this apparatus to determine the volume of one mole of carbon dioxide gas.

This is the student's method.

- a solid lump of sodium carbonate of mass 0.53 g is placed into the conical flask
- an excess of dilute nitric acid is added and the bung is put in place
- when all of the sodium carbonate has reacted, the volume of carbon dioxide collected is measured

The equation for the reaction is

- (a) (i) Calculate the amount, in moles, of sodium carbonate that reacts.  
 [ $M_r$ :  $\text{Na}_2\text{CO}_3 = 106$ ]

(2)

amount of sodium carbonate = ..... mol

- (ii) The volume of carbon dioxide collected is 110 cm<sup>3</sup>.

Use this information and your answer to (a)(i) to calculate the volume, in cm<sup>3</sup>, of one mole of carbon dioxide.

(2)

volume of one mole of carbon dioxide = ..... cm<sup>3</sup>

13 This question is about different metals.

The list shows part of the reactivity series of metals.

potassium	most reactive
sodium	↑
magnesium	↑
zinc	↑
iron	↑
lead	↑
copper	least reactive

(a) Name a metal from the list that is extracted by electrolysis.

(1)

(b) Uranium is a metal that is in between magnesium and zinc in the reactivity series.

Equal sized pieces of these three metals are placed in separate solutions of dilute hydrochloric acid of the same concentration and at the same temperature.

The observations for magnesium and zinc are shown in the table.

Complete the table by stating the observations that would be made for uranium.

(2)

Metal	Observations
magnesium	Bubbles of gas produced very rapidly. Solid disappears very quickly.
zinc	Bubbles of gas produced slowly. Solid disappears slowly.
uranium	

(c) (i) Metals high in the reactivity series react readily with water.

Name the compound formed when potassium reacts with water.

(1)

(ii) Give the formula of the compound formed when magnesium reacts with steam.

(1)

(d) Zinc can be extracted by heating zinc oxide with carbon.

The equation for the reaction is

(i) Explain whether zinc or carbon is the more reactive element.

(1)

.....

.....

.....

(ii) Explain which element is acting as a reducing agent in this reaction.
