

Electron Configuration

Learning Outcomes:

- 1) Describe how electrons are arranged in an atom
- 2) Deduce (work out) the electron configurations of the first 20 elements from their positions in the Periodic Table

Reviewing Atomic Structure

<p>12 Number $p^+ = 6$</p> <p>C Number $n^0 = 6$</p> <p>6 Number $e^- = 6$</p> <p>carbon</p>	<p>27 $p^+ = 13$</p> <p>Al $n^0 = 14$</p> <p>13 $e^- = 13$</p> <p>aluminium</p>	<p>16 $p^+ = 8$</p> <p>O $n^0 = 8$</p> <p>8 $e^- = 8$</p> <p>oxygen</p>

How to arrange electrons in an atom

Electrons are found in shells around the nucleus of an atom.

Each shell can only hold a certain number of electrons. Shells close to the nucleus always fill up first.

The arrangement of the electrons around the atom is called the **electron configuration**

Rules for working out the configuration of electrons:

Example – chlorine (Cl)

1) Use the periodic table to look up the atomic number. Chlorine's atomic number (number of protons) is 17.

2) Remember the number of protons = number of electrons.
Therefore chlorine has 17 electrons.

3) Arrange the electrons in shells:

- 1st shell can hold a maximum of 2
- 2nd can hold a maximum of 8
- 3rd can also hold 8

4) Check to make sure that the electrons add up to the right number:

$$2 + 8 + 7 = 17$$

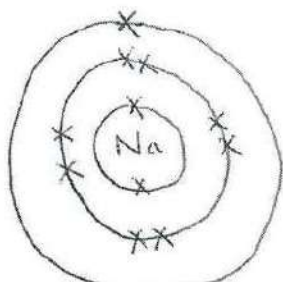

The electron configuration for chlorine can also be written as 2, 8, 7

Chlorine
2,8,7

Draw and write the electron configuration for Sodium:

23 $p^+ = 11$
Na $n^0 = 12$
" $e^- = 11$

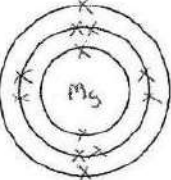

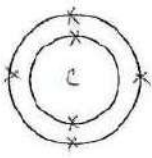

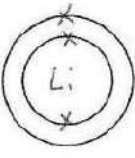

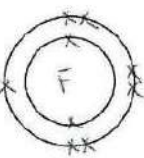

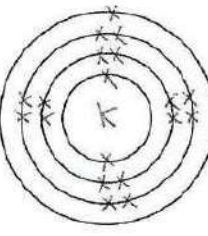

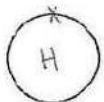

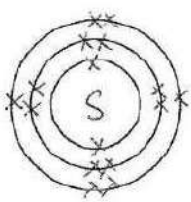

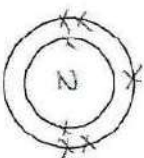

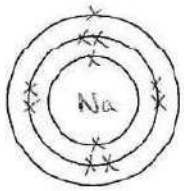

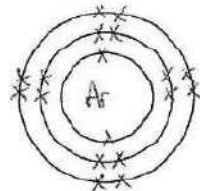

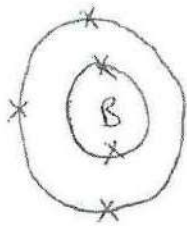

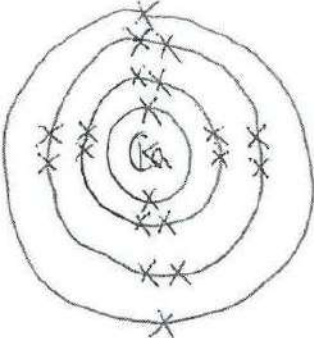

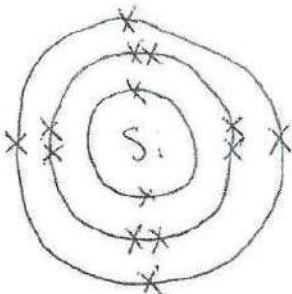

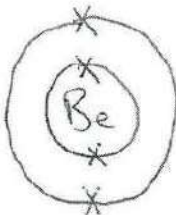

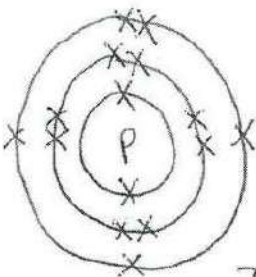

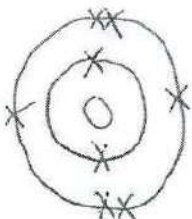

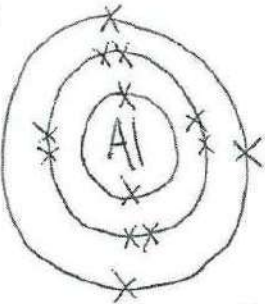

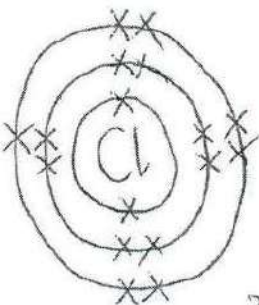

2, 8, 1

Task: Drawing the electron configurations.

Complete the table below to show diagrams of the electron configurations for the first 20 elements.

- Use a periodic table to help you
- Remember:
 - no more than two electrons in the first shell and no more than eight in the next
 - shells closest to the nucleus are filled first

<p>helium</p>  <p>2</p>	<p>magnesium</p>  <p>2, 8, 2</p>	<p>carbon</p>  <p>2, 4</p>	<p>neon</p>  <p>2, 8</p>
<p>lithium</p>  <p>2, 1</p>	<p>fluorine</p>  <p>2, 7</p>	<p>potassium</p>  <p>2, 8, 8, 1</p>	<p>hydrogen</p>  <p>1</p>
<p>sulfur</p>  <p>2, 8, 6</p>	<p>nitrogen</p>  <p>2, 5</p>	<p>sodium</p>  <p>2, 8, 1</p>	<p>argon</p>  <p>2, 8, 8</p>

<p>boron</p>  <p>2, 3</p>	<p>calcium</p>  <p>2, 8, 8, 2</p>
<p>silicon</p>  <p>2, 8, 4</p>	<p>beryllium</p>  <p>2, 2</p>
<p>phosphorous</p>  <p>2, 8, 5</p>	<p>oxygen</p>  <p>2, 6</p>
<p>aluminium</p>  <p>2, 8, 3</p>	<p>chlorine</p>  <p>2, 8, 7</p>

The Periodic Table

Learning Outcomes:

- 1) Describe how the electron configuration of an element is related to its position in the Periodic Table.
- 2) Explain why elements in the same group of the Periodic Table have similar chemical properties.
- 3) Explain why the noble gases (Group 0) are inert (do not easily react).
- 4) Identify group 1 and 7 elements as alkali metals and halogens.

Task: Write the electron configurations in Periodic Table below for the first 20 elements. The first 3 have been done for you.

group	1	2	3	4	5	6	7	0
period								
1	H 1							He 2
2	Li 2,1	Be 2,2	B 2,3	C 2,4	N 2,5	O 2,6	F 2,7	Ne 2,8
3	Na 2,8,1	Mg 2,8,2	Al 2,8,3	Si 2,8,4	P 2,8,5	S 2,8,6	Cl 2,8,7	Ar 2,8,8
4	K 2,8,8,1	Ca 2,8,8,2						

- 1) What is the relationship between the electron configuration of an atom and its group number?

The number of electrons in the outer shell is equal to the group number

- 2) What is the relationship between the electron configuration of an atom and its period?

The number of shells equals the period number

Task: Complete this Periodic Table to show the positions of:
Groups, Periods, alkali metals, halogens, noble gases, diatom

group → 1 ↓ 1	2 ↓ 2	3 ↓ 3	4 ↓ 4	5 ↓ 5	6 ↓ 6	7 ↓ 7	8 ↓ 8	9 ↓ 9	10 ↓ 10	11 ↓ 11	12 ↓ 12	13 ↓ 13	14 ↓ 14	15 ↓ 15	16 ↓ 16	17 ↓ 17	18 ↓ 18	19 ↓ 19	20 ↓ 20	21 ↓ 21	22 ↓ 22	23 ↓ 23	24 ↓ 24	25 ↓ 25	26 ↓ 26	27 ↓ 27	28 ↓ 28	29 ↓ 29	30 ↓ 30	31 ↓ 31	32 ↓ 32	33 ↓ 33	34 ↓ 34	35 ↓ 35	36 ↓ 36	37 ↓ 37	38 ↓ 38	39 ↓ 39	40 ↓ 40	41 ↓ 41	42 ↓ 42	43 ↓ 43	44 ↓ 44	45 ↓ 45	46 ↓ 46	47 ↓ 47	48 ↓ 48	49 ↓ 49	50 ↓ 50	51 ↓ 51	52 ↓ 52	53 ↓ 53	54 ↓ 54	55 ↓ 55	56 ↓ 56	57 ↓ 57	58 ↓ 58	59 ↓ 59	60 ↓ 60	61 ↓ 61	62 ↓ 62	63 ↓ 63	64 ↓ 64	65 ↓ 65	66 ↓ 66	67 ↓ 67	68 ↓ 68	69 ↓ 69	70 ↓ 70	71 ↓ 71	72 ↓ 72	73 ↓ 73	74 ↓ 74	75 ↓ 75	76 ↓ 76	77 ↓ 77	78 ↓ 78	79 ↓ 79	80 ↓ 80	81 ↓ 81	82 ↓ 82	83 ↓ 83	84 ↓ 84	85 ↓ 85	86 ↓ 86	87 ↓ 87	88 ↓ 88	89 ↓ 89	90 ↓ 90	91 ↓ 91	92 ↓ 92	93 ↓ 93	94 ↓ 94	95 ↓ 95	96 ↓ 96	97 ↓ 97	98 ↓ 98	99 ↓ 99	100 ↓ 100	101 ↓ 101	102 ↓ 102	103 ↓ 103	104 ↓ 104	105 ↓ 105	106 ↓ 106	107 ↓ 107	108 ↓ 108	109 ↓ 109	110 ↓ 110	111 ↓ 111	112 ↓ 112	113 ↓ 113	114 ↓ 114	115 ↓ 115	116 ↓ 116	117 ↓ 117	118 ↓ 118	119 ↓ 119	120 ↓ 120	121 ↓ 121	122 ↓ 122	123 ↓ 123	124 ↓ 124	125 ↓ 125	126 ↓ 126	127 ↓ 127	128 ↓ 128	129 ↓ 129	130 ↓ 130	131 ↓ 131	132 ↓ 132	133 ↓ 133	134 ↓ 134	135 ↓ 135	136 ↓ 136	137 ↓ 137	138 ↓ 138	139 ↓ 139	140 ↓ 140	141 ↓ 141	142 ↓ 142	143 ↓ 143	144 ↓ 144	145 ↓ 145	146 ↓ 146	147 ↓ 147	148 ↓ 148	149 ↓ 149	150 ↓ 150	151 ↓ 151	152 ↓ 152	153 ↓ 153	154 ↓ 154	155 ↓ 155	156 ↓ 156	157 ↓ 157	158 ↓ 158	159 ↓ 159	160 ↓ 160	161 ↓ 161	162 ↓ 162	163 ↓ 163	164 ↓ 164	165 ↓ 165	166 ↓ 166	167 ↓ 167	168 ↓ 168	169 ↓ 169	170 ↓ 170	171 ↓ 171	172 ↓ 172	173 ↓ 173	174 ↓ 174	175 ↓ 175	176 ↓ 176	177 ↓ 177	178 ↓ 178	179 ↓ 179	180 ↓ 180	181 ↓ 181	182 ↓ 182	183 ↓ 183	184 ↓ 184	185 ↓ 185	186 ↓ 186	187 ↓ 187	188 ↓ 188	189 ↓ 189	190 ↓ 190	191 ↓ 191	192 ↓ 192	193 ↓ 193	194 ↓ 194	195 ↓ 195	196 ↓ 196	197 ↓ 197	198 ↓ 198	199 ↓ 199	200 ↓ 200	201 ↓ 201	202 ↓ 202	203 ↓ 203	204 ↓ 204	205 ↓ 205	206 ↓ 206	207 ↓ 207	208 ↓ 208	209 ↓ 209	210 ↓ 210	211 ↓ 211	212 ↓ 212	213 ↓ 213	214 ↓ 214	215 ↓ 215	216 ↓ 216	217 ↓ 217	218 ↓ 218	219 ↓ 219	220 ↓ 220	221 ↓ 221	222 ↓ 222	223 ↓ 223	224 ↓ 224	225 ↓ 225	226 ↓ 226	227 ↓ 227	228 ↓ 228	229 ↓ 229	230 ↓ 230	231 ↓ 231	232 ↓ 232	233 ↓ 233	234 ↓ 234	235 ↓ 235	236 ↓ 236	237 ↓ 237	238 ↓ 238	239 ↓ 239	240 ↓ 240	241 ↓ 241	242 ↓ 242	243 ↓ 243	244 ↓ 244	245 ↓ 245	246 ↓ 246	247 ↓ 247	248 ↓ 248	249 ↓ 249	250 ↓ 250	251 ↓ 251	252 ↓ 252	253 ↓ 253	254 ↓ 254	255 ↓ 255	256 ↓ 256	257 ↓ 257	258 ↓ 258	259 ↓ 259	260 ↓ 260	261 ↓ 261	262 ↓ 262	263 ↓ 263	264 ↓ 264	265 ↓ 265	266 ↓ 266	267 ↓ 267	268 ↓ 268	269 ↓ 269	270 ↓ 270	271 ↓ 271	272 ↓ 272	273 ↓ 273	274 ↓ 274	275 ↓ 275	276 ↓ 276	277 ↓ 277	278 ↓ 278	279 ↓ 279	280 ↓ 280	281 ↓ 281	282 ↓ 282	283 ↓ 283	284 ↓ 284	285 ↓ 285

Task: Answer the following the questions using the periodic table.

1) Which group in the Periodic Table will you find the following elements?

- a) Sodium 1.....
- b) Xenon 0.....
- c) Selenium 6.....
- d) Niobium Transition metals.....

2) Which period in the Periodic Table will you find the following elements?

- a) Silicon 3.....
- b) Iridium 6.....
- c) Barium 6.....
- d) Gallium 4.....

3) How many electrons are in the outer shell of the following elements?

- a) Caesium 1.....
- b) Arsenic 5.....
- c) Lead 4.....
- d) Argon 8.....

4) How many shells do the following elements have?

- a) Helium 1.....
- b) Iodine 5.....
- c) Strontium 5.....
- d) Manganese 4.....

5) Name the element in group 2, period 4 calcium.....

6) Name the halogen in period 3 chlorine.....

7) Name the alkali metal in period 5 ~~strontium~~ rubidium.....

8) Name the noble gas in period 6 radon.....

9) How many elements have a symbol containing only one letter? 13.....

10) How many elements begin with the letter C? 8.....

11) Divide the list into metals and non-metals:

Caesium, Chlorine, Molybdenum, Neon, Nickel, Nitrogen, Strontium, Tin

Metals	Non-metals
Caesium Molybdenum Nickel Strontium Tin	Chlorine Neon Nitrogen

12) Sodium and potassium both react vigorously with water producing hydrogen gas and an alkaline solution. Suggest why the two metals show a similar chemical reaction.

- They are in the same group in the Periodic Table
- They have the same no. of e^- in the outer shell

13) Suggest why light bulbs are filled with argon gas. Explain your answer fully.

Argon is inert because it has a full outer shell. This prevents the metal filament from burning away.

14) Find out why some of the elements on the periodic table have brackets around their relative atomic masses.

These elements have no stable isotopes. The mass number in brackets represents the isotopes with the longest half-life

15) On your Periodic Table it states that elements with atomic numbers 112-116 have been reported but not fully authenticated. Find out what this statement means.

These are newly synthesised elements which are awaiting to be verified by IUPAC (112-118 have all now been verified).

Ions

Learning Outcomes:

- 1) Describe the formation of ions by the gain or loss of electrons
- 2) Draw & write the electron configurations of ions formed from the first 20 elements
- 3) Relate the charge on the ion to the element's position in the periodic table

Forming ions

Atoms will try to achieve a full outer shell by either gaining or losing electrons during a chemical reaction.

Key definition

An ion is an atom or group of atoms that carries a charge.

Sodium reacts with chlorine to produce sodium chloride as follows:

sodium + chlorine \rightarrow sodium chloride

When the chlorine atom reacts with the sodium atom it gains an outer electron and becomes a chloride ion.

The electron configuration of a chloride ion is as follows:

Writing the electron configuration:

Cl = 2, 8, 7

\rightarrow

$\text{Cl}^- = [2, 8, 8]$

Notice that the chloride ion has the symbol Cl^-

When the sodium atom reacts with the chlorine atom it loses an outer electron and becomes a sodium ion.

The electron configuration of a sodium ion is as follows:

Writing the electron configuration:

Na = 2, 8, 1

→

Na⁺ = [2, 8]⁺

Notice that the sodium ion has the symbol Na⁺

Draw the electron configuration of an oxide ion:

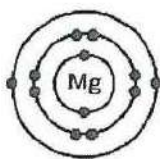

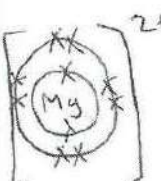

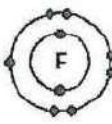

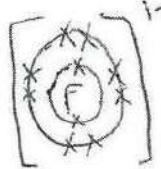

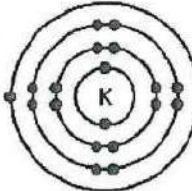

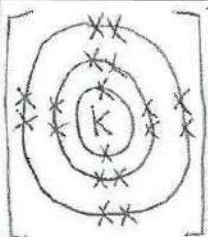

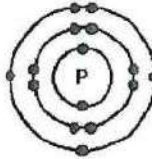

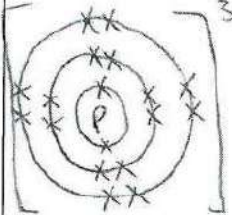

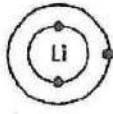

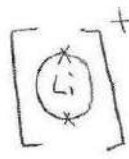

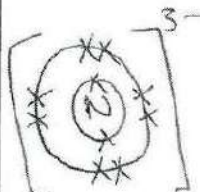

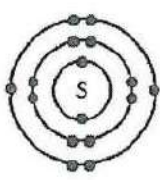

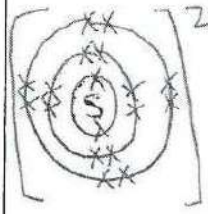

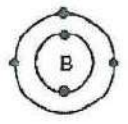

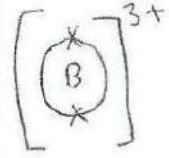

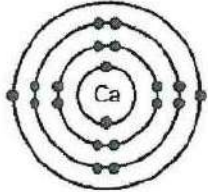

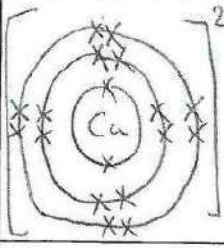

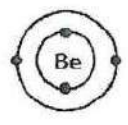

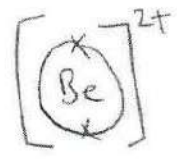

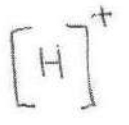

Draw the electron configuration of an aluminium ion:

Metal atoms usually have 1, 2 or 3 electrons in their outer shell. It is easier for them to achieve a full outer shell by losing electrons than by gaining them.

Non-metal atoms usually have 5, 6 or 7 electrons in their outer shell. It is easier for them to achieve a full outer shell by gaining electrons than by losing them.

Atom	How many electrons will the atom lose or gain?	What is the charge on the ion?	Formula of ion	Draw & write the electron configuration of the ion
	lose 2	2+	Mg ²⁺	 $Mg^{2+} = [2, 8]^{2+}$
	gain 1	1-	F ⁻	 $F^- = [2, 8]^-$
	lose 1	1+	K ⁺	 $K^+ = [2, 8, 8]^+$
	gain 3	3-	P ³⁻	 $P^{3-} = [2, 8, 8]^{3-}$
	lose 1	1+	Li ⁺	 $Li^+ = [2]^+$
	gain 3	3-	N ³⁻	 $N^{3-} = [2, 8]^{3-}$

Atom	How many electrons will the atom lose or gain?	What is the charge on the ion?	Formula of ion	Draw & write the electron configuration of the ion
	gain 2	2-	S^{2-}	 $S^{2-} = [2, 8, 8]^{2-}$
	lose 3	3+	B^{3+}	 $B^{3+} = [2]^{3+}$
	lose 2	2+	Ca^{2+}	 $Ca^{2+} = [2, 8, 8]^{2+}$
	lose 2	2+	Be^{2+}	 $Be^{2+} = [2]^{2+}$
	lose 1	1+	H^{+}	 $H^{+} = [0]^{+}$

- All the ions formed above, apart from the hydrogen ion, have the same electron configuration as which group of elements in the periodic table? 0 - Noble gases
- A hydrogen ion consists of only which subatomic particle? proton

Ions and the Periodic Table

Task: Research the charge that each of the ions that each element forms and write it in the space provided. Ignore the ones that have been greyed out. The second periodic table is to help you identify which space relates to which element.

1	2											3	4	5	6	7	0
+1	+2											+3		-3	-2	-1	
+1	+2											+3		-3	-2	-1	
+1	+2													-3	-2	-1	
+1	+2														-2	-1	
+1	+2															-1	

																	He
Li	Be											B	C	N	O	F	Ne
Na	Mg											Al	Si	P	S	Cl	Ar
K	Ca	Sc	Ti	V	Cr	Mn	Fe	Co	Ni	Cu	Zn	Ga	Ge	As	Se	Br	Kr
Rb	Sr	Y	Zr	Nb	Mo	Tc	Ru	Rh	Pd	Ag	Cd	In	Sn	Sb	Te	I	Xe
Cs	Ba	Lu	Hf	Ta	W	Re	Os	Ir	Pt	Au	Hg	Tl	Pb	Bi	Po	At	Rn

1) Are there any patterns?

Ions in the same group have the same charge.

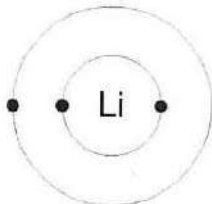

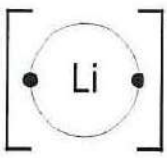

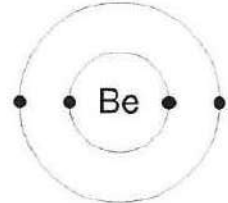

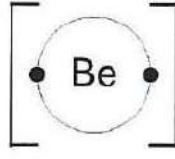

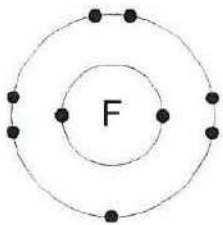

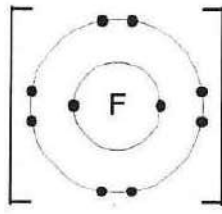

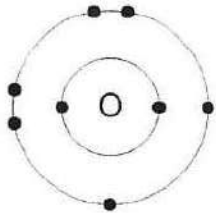

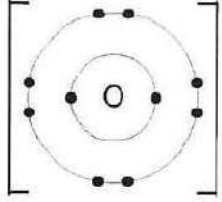

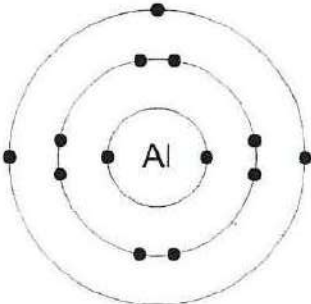

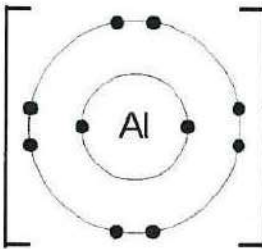

2) How could this help you to know the charge of an ion?

Identifying which group an element is in will help you work out the charge on the ion.

3) Why do you think you were asked to ignore the greyed out elements?

These elements have variable charges on their ions.

Task: Complete the table by filling in the missing information and writing the charge of the ion onto the electron configuration.

ATOMS		IONS	
	3 protons 3 electrons = no charge		3 protons 2 electrons = + 1 charge
	4 protons 4 electrons = no charge		4 protons 2 electrons = 2+ charge
	9 protons 9 electrons = no charge		9 protons 10 electrons = 1- charge
	8 protons 8 electrons = no charge		8 protons 10 electrons = 2- charge
	13 protons 13 electrons = no charge		13 protons 10 electrons = 3+ charge

Task: Complete the table and work out whether the element is an atom or an ion?

Remember:

- In an atom, the number of protons and electrons is equal
- An ion has a charge (i.e. the number of electrons is different from the number of protons)

Element	Number of protons	Number of electrons	Charge	Atomic number	Atom or ion?
H	1	1	0	1	atom
O	8	8	zero	8	atom
Mg	12	10	+2	12	ion
Al	13	10	+3	13	ion
O	8	10	-2	8	ion
Mg	12	12	0	12	atom
F	9	10	-1	9	ion
Ne	10	10	zero	10	atom
Na	11	10	+1	11	ion
Li	3	3	zero	3	atom
Be	4	2	+2	4	ion
Ca	20	18	+2	20	ion
S	16	18	-2	16	ion

Ionic Bonding

Learning Outcomes:

- 1) Recall the definition of an ionic bond
- 2) Explain, using dot and cross diagrams, the formation of ionic compounds by electron transfer, limited to combinations of elements from groups 1,2,3 and 5,6,7

Ionic bonding in sodium chloride

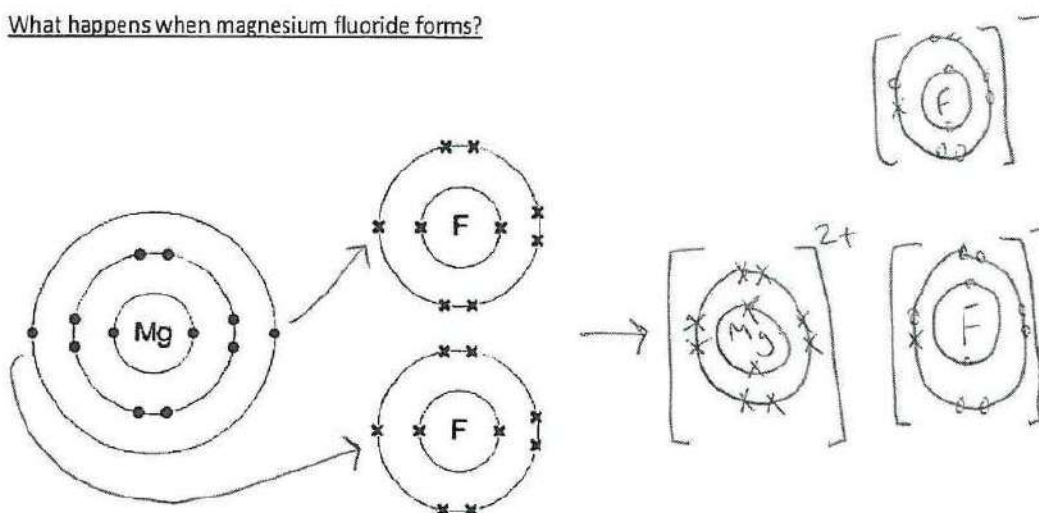

The single electron in the outer energy level of the sodium atom has been transferred to the chlorine. The sodium chloride is held together by the strong electrostatic attractions between the positive sodium ion and the negative chloride ion.

Key definition

An **Ionic Bond** is the electrostatic attraction between oppositely charged ions.

What happens when magnesium fluoride forms?

Formula = MgF₂

ionic bonding in calcium oxide

Formula = CaO

ionic bonding in sodium sulfide

Formula = Na₂S

Task: Draw the dot & cross diagrams for the following ionic compounds and deduce (work out) their formula:

Potassium
fluoride

Formula = KF

Magnesium
chloride

Formula = MgCl₂

Aluminium
chloride

Formula = AlCl₃

Sodium
oxide

Formula = Na₂O

Magnesium
oxide

Formula = MgO

Sodium
nitride

Formula = Na₃N

Calcium
sulfide

Formula = CaS

Aluminium
oxide

Formula = Al_2O_3

Lithium
sulfide

Formula = Li_2S

Potassium
phosphide

Formula = K_3P

Magnesium
nitride

Formula = Mg_3N_2

Aluminium nitride

Formula = AlN

Lithium
phosphide

Formula = Li_3P

Calcium fluoride

Formula = CaF_2

Potassium sulfide

Formula = K_2S

Lithium fluoride

Formula = LiF

Calcium phosphide

Formula = Ca_3P_2

Describing the formation of an ionic bond in words

The chemical equation for the reaction of magnesium with chlorine is shown below

By reference to electrons, describe how magnesium and chlorine atoms form magnesium chloride.

Magnesium loses two outer electrons to form Mg^{2+} ion.

Two chlorine atoms each gain an electron to form 2 Cl^- ions.

Hence, Magnesium Chloride, MgCl_2 forms.

The chemical equation for the reaction of sodium with oxygen is shown below

By reference to electrons, describe how sodium and oxygen atoms form sodium oxide.

Two sodium atoms lose an outer electron to form two Na^+ ions.

An oxygen atom gains an electron to form O^{2-} ion.

Hence, Sodium Oxide, Na_2O , forms.

Giant ionic structure

Learning Outcomes:

- 1) Describe the structure of an ionic compound
- 2) Explain why ionic compounds have high melting points

Key definition

A **lattice** is a regular and repeating structure of particles.

All ionic compounds have the structure of a giant ionic lattice.

The lattice is held together by strong electrostatic attractions between positively and negatively charged ions.

Structure of sodium chloride:

2D Structure

3D Structure

Task: Draw positive and negative ions onto the diagram below to show the arrangement of sodium and chloride ions in sodium chloride. Create a key to show which ions are sodium and chloride.

Key
⊖ chloride ions (Cl^-)
⊕ sodium ions (Na^+)

Melting points of ionic compounds

Ionic compounds, for example sodium chloride, have high melting points because they have:

- 1) a giant ionic lattice
- 2) with strong electrostatic forces between oppositely charged ions
- 3) that requires a lot of energy to break

Not an accurate
diagram of a
molten ionic compound

Task: Plot a graph to show the melting and boiling points of the ionic compounds in the table below and answer the questions.

Compound	Formula	Melting Point (°C)	Boiling Point (°C)
sodium iodide	NaI	660	1304
Potassium bromide	KBr	734	1435
sodium bromide	NaBr	747	1390
calcium chloride	CaCl ₂	782	1600
sodium chloride	NaCl	801	1413
magnesium oxide	MgO	2852	3600

Questions

1) Complete the table above by adding the names of compounds.

2) What temperature does calcium chloride freeze? 782°C

3) What temperature does potassium bromide condense? 1435°C

4) Write a chemical equation with state symbols to show the state change for sodium chloride at 801°C.

5) Which ionic compounds will be liquids at 746°C? NaI + KBr

6) Give the states of the last 3 compounds at 1500°C.

CaCl₂ Liquid

NaCl Gas

MgO Solid

7) Suggest why magnesium oxide has a much higher melting point than all the other compounds.

This is because $\text{Mg}^{2+} + \text{O}^{2-}$ ions have a higher charge than the other ions. Therefore the electrostatic forces between the ions are much stronger, requiring more energy to break.

Writing Chemical Formulae

Learning Outcomes:

- 1) Know the charges of these ions: Ag^+ , Cu^{2+} , Fe^{2+} , Fe^{3+} , Pb^{2+} , Zn^{2+} , hydrogen ion (H^+)
- 2) Write formulae for compounds formed between the ions listed above and those formed between metals in Groups 1, 2, 3, and non-metals in Groups 5, 6 and 7

Task: Name these ionic compounds

- a) ZnO zinc oxide
- b) AgF_2 silver fluoride
- c) Fe_2S_3 iron sulphide
- d) Cu_3N_2 copper nitride
- e) PbBr_2 lead bromide
- f) Na_2Se sodium selenide
- g) Ca_3As_2 calcium arsenide

As you know you can use the periodic table to work out the charges on the ions from group 1, 2, 3, 5, 6 & 7. There are however 7 monoatomic ions that you will come across at GCSE in which you cannot use the periodic to work out their charges.

Ion	Formula
hydrogen	H^+
silver	Ag^+
zinc	Zn^{2+}
copper (II)	Cu^{2+}
lead (II)	Pb^{2+}
iron(II)	Fe^{2+}
iron(III)	Fe^{3+}

← Memorise these

What is the meaning of the Roman numeral after an ion's name?

Indicates the charge on the metal ion.

Once you know the charges on the two ions in a compound you can work out the formula.

Writing the chemical formula for magnesium chloride:

- Step 1 - Write down the symbols: Mg Cl
- Step 2 - Add the charges: Mg^{2+} Cl^-
- Step 3 - Balance the charges: Mg^{2+} Cl^-
 Cl^-
- Step 4 - Write the formula: MgCl_2

Ionic compound	Ions	formula
Sodium chloride	$\text{Na}^{1+} \text{Cl}^{1-}$	NaCl
Sodium oxide	$\text{Na}^{1+} \text{O}^{2-}$ Na^{1+}	Na_2O
Magnesium oxide	$\text{Mg}^{2+} \text{O}^{2-}$	MgO
Beryllium fluoride	$\text{Be}^{2+} \text{F}^{-}$ F^{-}	BeF_2
Calcium chloride	$\text{Ca}^{2+} \text{Cl}^{-}$ Cl^{-}	CaCl_2
Aluminium oxide	$\text{Al}^{3+} \text{O}^{2-}$ $\text{Al}^{3+} \text{O}^{2-}$	Al_2O_3
Potassium chloride	$\text{K}^{+} \text{Cl}^{-}$	KCl
Lithium bromide	$\text{Li}^{+} \text{Br}^{-}$	LiBr
Magnesium iodide	$\text{Mg}^{2+} \text{I}^{-}$ I^{-}	MgI_2
Aluminium chloride	$\text{Al}^{3+} \text{Cl}^{-}$ Cl^{-} Cl^{-}	AlCl_3
Calcium oxide	$\text{Ca}^{2+} \text{O}^{2-}$	CaO
Lithium oxide	Li^{+} $\text{Li}^{+} \text{O}^{2-}$	Li_2O
Potassium oxide	K^{+} $\text{K}^{+} \text{O}^{2-}$	K_2O
Lithium nitride	Li^{+} $\text{Li}^{+} \text{N}^{3-}$ Li^{+}	Li_3N
Magnesium nitride	$\text{Mg}^{2+} \text{N}^{3-}$ Mg^{2+} $\text{Mg}^{2+} \text{N}^{3-}$	Mg_3N_2
Beryllium oxide	$\text{Be}^{2+} \text{O}^{2-}$	BeO

Ionic compound	Ions	Formula
Rubidium Bromide	$\text{Rb}^+ \text{Br}^-$	RbBr
Strontium Arsenide	$\text{Sr}^{2+} \text{As}^{3-}$	Sr_3As_2
Caesium Sulfide	$\text{Cs}^+ \text{S}^{2-}$	Cs_2S
Barium Astatide	$\text{Ba}^{2+} \text{At}^-$	BaAt_2
Gallium Selenide	$\text{Ga}^{3+} \text{Se}^{2-}$	Ga_2Se_3
Zinc Oxide	$\text{Zn}^{2+} \text{O}^{2-}$	ZnO
Lead Iodide	$\text{Pb}^{2+} \text{I}^-$	PbI_2
Silver Chloride	$\text{Ag}^+ \text{Cl}^-$	AgCl
Zinc Nitride	$\text{Zn}^{2+} \text{N}^{3-}$	Zn_3N_2
Hydrogen Bromide	$\text{H}^+ \text{Br}^-$	HBr
Iron(II) Chloride	$\text{Fe}^{2+} \text{Cl}^-$	FeCl_2
Iron(III) Chloride	$\text{Fe}^{3+} \text{Cl}^-$	FeCl_3
Copper(II) Phosphide	$\text{Cu}^{2+} \text{P}^{3-}$	Cu_3P_2
Copper(II) Chloride	$\text{Cu}^{2+} \text{Cl}^-$	CuCl_2
Iron(II) Oxide	$\text{Fe}^{2+} \text{O}^{2-}$	FeO
Iron(III) Oxide	$\text{Fe}^{3+} \text{O}^{2-}$	Fe_2O_3

Chemical Equations

Learning Outcomes:

- 1) Write chemical formulae for ionic compounds
- 2) Write word equations and balanced chemical equations

Task: Balance the following equations

Writing chemical equations

Note – all the non-metals in these questions are diatomic molecules, e.g. O_2 N_2 F_2 Cl_2 Br_2 I_2 H_2

Example: Magnesium reacts with oxygen to form magnesium oxide

1) Write the word equation: magnesium + oxygen \rightarrow magnesium oxide

2) Write the chemical formulae: $\text{Mg} + \text{O}_2 \rightarrow \text{MgO}$

3) Balance the equation: $2\text{Mg} + \text{O}_2 \rightarrow 2\text{MgO}$

- a) Sodium reacts with fluorine gas producing sodium fluoride

- b) A piece of magnesium strip reacts with iodine to form magnesium iodide

- c) Barium reacts with oxygen to produce barium oxide

- d) Aluminium nitride is formed when aluminium reacts with nitrogen

- e) Potassium reacts with bromine to form potassium bromide

- f) When a piece of magnesium strip is dropped into hydrochloric acid (HCl), hydrogen gas is given off and a solution of magnesium chloride is formed.

- g) Chlorine gas reacts with potassium iodide to produce potassium chloride and iodine

- h) Fluorine reacts with copper produce copper(II) fluoride

- i) Iron reacts with bromine to form iron(II) bromide

- j) A piece of zinc reacts with hydrochloric acid (HCl) to form zinc chloride and hydrogen gas

- k) On heating iron reacts with sulfur (S_8) to produce iron(II) sulfide

- l) Iron is formed when potassium reacts with iron(III) oxide

- m) Aluminium displaces silver when reacted with silver oxide

- n) Aluminium nitride is formed when aluminium reacts with copper(II) nitride

Key words

Term	Definition
Electron configuration	How the <u>electrons</u> are arranged in an atom.
Group	The elements found in one <u>column</u> of the periodic table
Period	The elements found in one <u>row</u> of the periodic table
Noble Gases	Gaseous elements occupying group <u>0</u> . They are <u>inert</u>
<u>Alkali Metals</u>	Metal elements occupying group 1 of the periodic table.
<u>Halogens</u>	Non-metal elements occupying group 7 of the periodic table.
<u>Inert</u>	Chemically unreactive
Ion	An atom or group of atoms that carries a <u>charge</u>
<u>Ionic bond</u>	The electrostatic attraction between oppositely charged ions.
Electrostatic attraction	The attraction between particles with <u>oppositely</u> charges.
<u>Giant</u> structure	Large, repeating structure that extends in 3 dimensions
<u>Lattice</u>	A regular and repeating structure of particles

Q1

The picture shows sodium reacting with chlorine. The reaction forms sodium chloride.

- (a) Use words from the box to answer the questions.

compound

element

hydrocarbon

mixture

Which word best describes:

(i) sodium element

(1)

(ii) sodium chloride? compound

(1)

- (b) When sodium reacts with chlorine the sodium atoms change into sodium ions.

The diagrams below represent a sodium atom and a sodium ion.

Sodium atom (Na)

Sodium ion (Na⁺)

Use the diagrams to help you explain how a sodium atom turns into a sodium ion.

• A sodium atom loses its outer electron
• so becomes a sodium ion with +1 charge

(2)

Q2

- (a) The chemical equation for a reaction of sodium is shown below.

Describe this reaction in terms of electron transfer

2 sodium atoms each lose one electron

2 chlorine atoms each gain one electron

(3)

- (b) Use the periodic table on the data sheet to help you to answer this question.

- (i) Complete the electronic structure of sodium. atom

(2)

- (ii) How is the electronic structure of sodium different from the electronic structure of chlorine?

Chlorine has 7 electrons in its outer shell, but sodium only has 1.

(1)

Q3

Magnesium oxide is a white solid with a high melting point.

Explain how the ions are held together in solid magnesium oxide.

There is a strong electrostatic attraction between the oppositely charged ions.

(2)

Q4

Magnesium oxide is a compound, made up of magnesium ions and oxide ions.

(a) What is the charge on each magnesium ion? +2

(1)

(b) Explain how the magnesium ions get this charge.

A magnesium atom loses 2 electrons

(2)

Q5

Potassium sulfide is an ionic compound.

Complete the table to show the arrangement of electrons in the ions formed when potassium and sulfur react to form potassium sulfide.

Give the charge on each of the ions.

(3)

Element	Arrangement of electrons in atom	Arrangement of electrons in ion	Charge on ion
K	2.8.8.1	2.8.8	+1
S	2.8.6	2.8.8	-2

Q6

- (a) The diagram shows part of the ionic lattice of a sodium chloride crystal.

- (i) Complete the spaces in the table to give information about **both** of the ions in this lattice.

Name of ion	Charge
<u>sodium</u>	<u>+1</u>
<u>chloride</u>	<u>-1</u>

(2)

- (b) The symbol for a calcium atom can be shown like this: $\begin{matrix} 40 \\ \text{Ca} \\ 20 \end{matrix}$

- (i) What is the mass number of this atom?

40

(1)

- (ii) What information is given by the mass number?

mass number = protons + neutrons

(1)

Q7

- (a) The electronic structure of a sodium atom can be written 2,8,1.
Write the electronic structure of a potassium atom in the same way.

..... 2, 8, 8, 1

(1)

- (b) The electronic structure of a sodium atom can also be represented as in the diagram below.

- (i) Draw a similar diagram for a fluorine atom.

- (ii) Draw similar diagrams to show the electronic structure of the particles in sodium fluoride.

(4)

Q8

The table shows the electronic configurations of four elements.

Element	Electronic configuration
chlorine	2.8.7
argon	2.8.8
potassium	2.8.8.1
calcium	2.8.8.2

(a) Why is argon an unreactive element?

(1)

Full outer shell

(b) Krypton is an unreactive element in the same group of the Periodic Table as argon, but in Period 4. It has an atomic number of 36.

Deduce the electronic configuration of krypton.

(1)

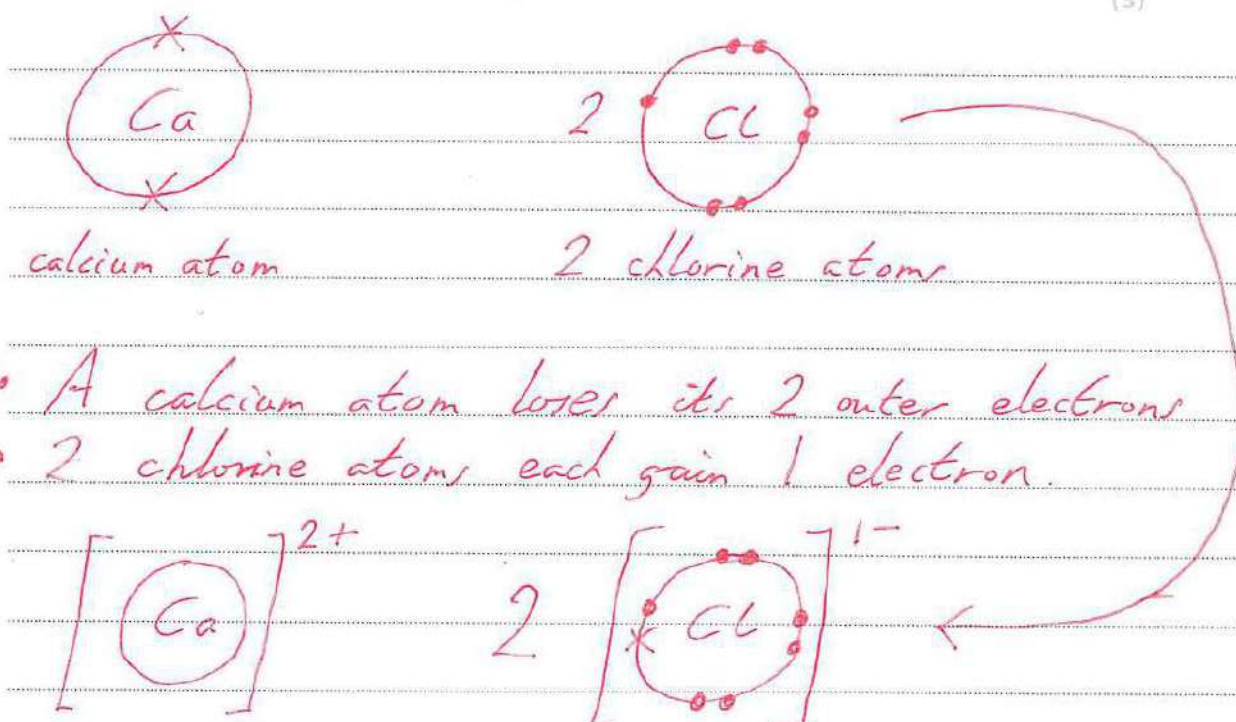

- ☐ A 2.8.8.8 = 26 x
- ☐ B 2.8.18.8 = 27 x
- ☒ C 2.8.8.2.8.8 = 36 ✓
- ☐ D 2.8.8.8.8.2 *outer shell not full x*

(c) Calcium reacts with chlorine to form the ionic compound calcium chloride (CaCl_2).

(i) Describe, in terms of electrons, how an atom of calcium reacts with two chlorine atoms to form calcium chloride.

You may use a diagram in your answer.

(3)

(ii) Write the formula of a calcium ion.

(1)

(iii) In the reaction between calcium and chlorine, both oxidation and reduction occur.

Which row shows the element that is oxidised and the element that acts as the reducing agent in this reaction?

(1)

	Element that is oxidised	Element that acts as the reducing agent
<input checked="" type="checkbox"/> A	calcium	calcium
<input type="checkbox"/> B	calcium	chlorine
<input type="checkbox"/> C	chlorine	calcium
<input type="checkbox"/> D	chlorine	chlorine

Not in topic

Q9

Magnesium and chlorine react together to form magnesium chloride, a compound with ionic bonding.

The equation for the reaction is

- (i) Complete the dot and cross diagram to show the arrangement of the outer electrons in the magnesium and chloride ions formed.

Show the charge on each ion.

- (ii) State what is meant by the term **ionic bonding**.

(2)

Ionic bonding is the strong electrostatic attraction between oppositely charged ions.

- (iii) Explain why magnesium chloride has a high melting point.

(3)

The electrostatic attraction between the oppositely charged ions is strong and takes lots of energy to break.
